

Exercise 14

AIM :

To write a C program for the below requirements

1. Copy contents from one file to another file

ALGORITHM :

Step 1: Start

1. Begin execution of the program.

Step 2: Declare Variables

2. Declare:
 - Two file pointers: source and destination
 - Character arrays to store source and destination filenames
 - A character variable ch to read file contents

Step 3: Read Filenames

3. Prompt the user to enter:
 - Source file name
 - Destination file name
4. Read both filenames using standard input.

Step 4: Open Source File

5. Open the source file in **read mode ("r")**.
6. If the source file cannot be opened:
 - Display an error message
 - Terminate the program.

Step 5: Open Destination File

7. Open the destination file in **write mode ("w")**.
8. If the destination file cannot be created:
 - Display an error message
 - Close the source file

- Terminate the program.

Step 6: Copy File Contents

9. Read characters from the source file one by one using `fgetc()`.
10. Write each character to the destination file using `fputc()`.
11. Repeat until **end-of-file (EOF)** is reached.

Step 7: Display Success Message

12. Print a message indicating that the file has been copied successfully.

Step 8: Close Files

13. Close the source file.
14. Close the destination file.

Step 9: Stop

15. End the program execution.

OUTPUT :

```
PS D:\C programming\DHAVAMANI_EX14> gcc main.c -o main
PS D:\C programming\DHAVAMANI_EX14> ./main
Enter source filename: src.txt
Enter destination filename: dest.txt
File copied successfully!
```
